

Beneficial Microbes to Optimize pest control in Sustainable Tomato production

**BeMOST
HFRI-FM17-50**

D2.1 Plant-mediated effects of BM (fungi/bacteria) on natural enemies' behavior (CO)

Summary

D2.1 is a deliverable of WP2 which aims to identify beneficial microbes that induce tomato resistance against herbivores that are also compatible with biological control agents. The objectives to achieve this are:

- 2.1. To study the effects of selected beneficial microbes on organisms belonging to the third trophic level (i.e., predators/parasitoids - tri-trophic interactions);
- 2.2. To identify promising beneficial microbe strains per arthropod species that enhance biological control with natural enemies (predators, parasitoids) – indirect resistance.

In the context of the WP2 objectives, D2.1 reports on the effects of microbe-induced resistance on the behavior of natural enemies towards plants infested with BeMOST herbivores.
